SEVA INNOVATION CHALLENGE 2026 • REFERENCE PITCH DECK

PathForge AI | CYBERSTARS

Career pathways that respect a student's skills, time, device and budget.

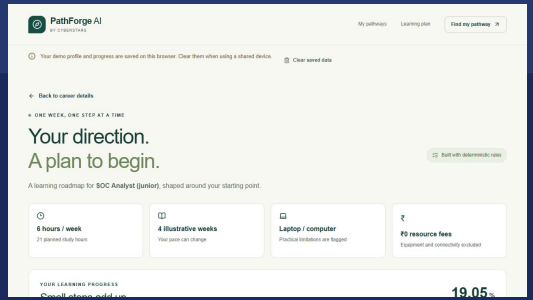

General | Education & Employability
Working prototype: Phases 1–2
Aarush Tendulkar | CYBERSTARS
Local demonstration; public deployment pending

Working local prototype

- 12 careers · 36 skills

33 checked learning references
Explained matching and weekly plans
Progress saved on the student's browser

AI, quizzes and translations are planned; they are not implemented.

2

The Problem

Problem hypothesis: career advice should account for practical learning constraints.

What is the problem?

Students may know a career goal but struggle to connect current skills with realistic next steps. A useful plan needs to reflect time, device access and budget.

Who is affected, and where?

Intended users: diploma, ITI, undergraduate and first-generation job seekers in Maharashtra and similar regions. No measured beneficiary count is claimed.

Evidence

No student interviews or field pilot yet. Problem and curriculum assumptions require local review. Current evidence is a working prototype and automated checks.

Current gaps

Hypothesis to test: generic plans can overlook device access, prerequisite skills and available study hours. No competitor cost or speed benchmark has been performed.

Not measured

Target reach is to be established through a consenting pilot.

Why it matters

Aim: make the next learning step understandable and feasible without promising a job.

3 Our Solution & Innovation

Built: guest onboarding → explained matches → career gaps → weekly roadmap → local progress.

Our solution in brief

A Next.js interface and FastAPI service calculate career matches with transparent rules. The planner schedules prerequisites, free references and activities within weekly hours, with explicit device limitations.

How it works

1 **Input**

Skills, interests, time, budget and device

›

2 **Process**

Weighted matching + prerequisite planning

›

3 **Output**

Three paths, exact gaps and weekly tasks

What makes it new?

	Baseline to validate	Current prototype
Cost	Not benchmarked	No paid API calls
Speed / time	Not benchmarked	Weekly hours constrained
Reach / access	Not benchmarked	Guest; phone limits explicit
Ease of use	Not benchmarked	Explained scores; pilot planned

Key USP

Same SOC goal: 6h/week + laptop gives 4 illustrative weeks; 4h/week + phone gives 6 weeks and theory alternatives. This is a design mechanism, not a validated novelty or patent claim.

4 Feasibility & Implementation

Working locally; public hosting and human validation remain pending.

Current stage (mark ✓ where you are today)

Idea — Proof of Concept — ✓ Working Prototype — Field Pilot — Ready to Deploy

Technology

Next.js + TypeScript, FastAPI + Pydantic, SQLite/SQLAlchemy/Alembic. No LLM API. Browser-local progress. Expert administration and a gated public directory are implemented. See the verification record for current test counts.

Estimated cost

Current demo: zero paid API calls; free public reading references. Free hosting is conditional on provider limits, not an always-on guarantee. Pilot staffing/device costs are not yet quoted.

Timeline

Proposed: 3 months—review mappings and a small consenting pilot; 6 months—evaluate usefulness and refine; 12 months—consider expansion if evidence supports it. These are targets, not completed milestones.

Partners

No adoption or institutional partner confirmed. Seeking educators/counsellors for curriculum review and access to consenting students for a pilot.

5 Impact & Scalability

Intended impact; outcomes have not yet been measured.

Pilot planned

Beneficiaries reached

5–10 consenting students proposed; not recruited

Not measured

Saving in cost / time

No baseline time/cost comparison yet

Not measured

Jobs or livelihoods

No placement or job-creation claim

Social impact

Aim: clearer career exploration for students with different devices, study hours and budgets. Phone alternatives support theory; practical work still needs appropriate access.

Sustainability

Current prototype avoids paid AI. Longer-term hosting, maintenance and curriculum review need a sustainable sponsor/institution model; no revenue or funding is claimed.

Scale-up plan

Start with local curriculum review. Track explanation comprehension, usefulness (1–5), task completion and resource availability, then expand only after reviewing evidence.

6

Team/Individual & Support Required

CYBERSTARS | Aarush Tendulkar, Team Lead | Team size: 1. Guidance experts are separate.

No photo supplied

Team Lead | CYBERSTARS

Qualification: to be confirmed

Project team: Aarush Tendulkar, Team Lead. Team size: 1. Student guidance experts are managed separately in the application. No experts or institutional partners are confirmed.

Mentor / institutional partner: none confirmed

Contact: | Public demo URL: pending deployment

Support we are seeking

- ☐ Requested: mentorship and curriculum review
- ☐ Requested: access to a consenting local pilot
- ☐ Funding needs: not quoted; define after pilot design
- ☐ Incubation: optional future support
- ☐ Requested: accessibility and evaluation guidance

Support would help test usefulness and feasibility with students before making impact or readiness claims.
